

# THE ART OF STAIN REMOVAL

**Poulticing** is a long process to introduce however this method is proven to be the most effective way to remove stains that have penetrated into the interior of the stone. Poulticing is to reverse the staining process. In other words, poultice powder with the appropriate chemicals will literally suck the stain out from the stone. Each application required leaving the poultice on the stains area for 1-2 days, depending on the age of the stains. Any stains occurred on natural stones are unpredictable. Some stains could have penetrated deeper and spread wider inside the stone. Identifying the types of stain is already half the battle won.

**Procedure to remove penetrated oil stain on marble, granite & all other type of stones using SCL-OE2 chemical mix with SCL-PPP Poultice Powder. Application procedure is as follow:**

**Step 1: Mix SCL-OE2 chemical with SCL-PPP Poultice Powder into a paste.**

**Step 2: Cover the paste with clear plastic sheet and tape down the edges with a low adhesive tape**

**Step 3: Leave the poultice to react for 24 hours. Removed the Poultice when it is thoroughly dry and hardened in this condition. Dispose the poultice in a plastic bag.**
