

THE ART OF STAIN REMOVAL

Poulticing is a long process to introduce however this method is proven to be the most effective way to remove stains that have penetrated into the interior of the stone. Poulticing is to reverse the staining process. In other words, poultice powder with the appropriate chemicals will literally suck the stain out from the stone. Each application required leaving the poultice on the stains area for 1-2 days, depending on the age of the stains. Any stains occurred on natural stones are unpredictable. Some stains could have penetrated deeper and spread wider inside the stone. Identifying the types of stain is already half the battle won.

Procedure to remove penetrated stains on polished/unpolished granite stone only using SCL-RA2 Part A + SCL-RA2 Part B chemical mix with SCL-DPP Poultice Powder. Application procedures are as follow:

Paste is too dry

Paste is too wet

Paste is just right

If paste gets too wet, just sprinkle some DPP Powder at the edge of the paste to stop the flow.

Cover with plastic and removed after 48 hours
